It is necessary to ensure that the right representation is used on each machine. Functions are used to convert from host to network form before transmission- htons for short integers and htonl for long integers.

The value for servaddr.sin addr is assigned using the following function

### inet pton(AF INET, "IP Address", &servaddr.sin addr);

The binary value of the dotted decimal IP address is stored in the field when the function returns.

## 3. Binding of the client socket to a local port

This is optional in the case of client and we usually do not use the bind function on the client side.

#### 4. Connection of client to the server

A server is identified by an IP address and a port number. The connection operation is used on the client side to identify and start the connection to the server.

int connect(int sd, struct sockaddr \* addr, int addrlen);

```
sd – file descriptor of local socket
addr – pointer to protocol address of other socket
addrlen – length in bytes of address structure
```

The header files to be used are sys/types.h and sys/socket.h

It returns 0 on sucess and -1 in case of failure.

# 5. Reading from socket

In the case of TCP connection reading from a socket can be done using the read system call

```
int read(int sd, char * buf, int length);
```

### 6. writing to a socket

In the case of TCP connection writing to a socket can be done using the write system call

```
int write( int sd, char * buf, int length);
```
